S.Brin and L.Page, Comp. Networks ISDN Systems 30, 107 (1998)

## How Google works

## Markov chains (1906) and Directed networks

 Weighted adjacency matrix

$$
\mathbf{S}=\left(\begin{array}{ccccccc}
0 & 0 & 0 & 0 & 0 & 0 & 0 \\
\frac{1}{3} & 0 & 0 & 0 & 0 & 0 & 0 \\
\frac{1}{3} & 0 & 0 & \frac{1}{2} & 0 & 0 & 0 \\
\frac{1}{3} & 0 & 0 & 0 & 1 & 1 & 1 \\
0 & 0 & 0 & \frac{1}{2} & 0 & 0 & 0 \\
0 & 1 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0
\end{array}\right)
$$

For a directed network with $N$ nodes the adjacency matrix $\mathbf{A}$ is defined as $A_{i j}=1$ if there is a link from node $j$ to node $i$ and $A_{i j}=0$ otherwise. The weighted adjacency matrix is

$$
S_{i j}=A_{i j} / \sum_{k} A_{k j}
$$

In addition the elements of columns with only zeros elements are replaced by 1/N.

## How Google works

Google Matrix and Computation of PageRank $\mathbf{P}=\mathbf{S P} \Rightarrow \mathbf{P}=$ stationary vector of $\mathbf{S}$; can be computed by iteration of $\mathbf{S}$.
To remove convergence problems:

- Replace columns of 0 (dangling nodes) by $\frac{1}{N}$ :

$$
\mathbf{S}=\left(\begin{array}{ccccccc}
0 & 0 & \frac{1}{7} & 0 & 0 & 0 & 0 \\
\frac{1}{3} & 0 & \frac{1}{7} & 0 & 0 & 0 & 0 \\
\frac{1}{3} & 0 & \frac{1}{7} & \frac{1}{2} & 0 & 0 & 0 \\
\frac{1}{3} & 0 & \frac{1}{7} & 0 & 1 & 1 & 1 \\
0 & 0 & \frac{1}{7} & \frac{1}{2} & 0 & 0 & 0 \\
0 & 1 & \frac{1}{7} & 0 & 0 & 0 & 0 \\
0 & 0 & \frac{1}{7} & 0 & 0 & 0 & 0
\end{array}\right) ; \mathbf{S}^{*}=\left(\begin{array}{ccccccc}
\frac{1}{7} & 1 & \frac{1}{2} & \frac{1}{4} & 0 & 0 & \frac{1}{7} \\
\frac{1}{7} & 0 & 0 & 0 & 0 & 1 & \frac{1}{7} \\
\frac{1}{7} & 0 & 0 & 0 & 0 & 0 & \frac{1}{7} \\
\frac{1}{7} & 0 & \frac{1}{2} & 0 & 1 & 0 & \frac{1}{7} \\
\frac{1}{7} & 0 & 0 & \frac{1}{4} & 0 & 0 & \frac{1}{7} \\
\frac{1}{7} & 0 & 0 & \frac{1}{4} & 0 & 0 & \frac{1}{7} \\
\frac{1}{7} & 0 & 0 & \frac{1}{4} & 0 & 0 & \frac{1}{7}
\end{array}\right) .
$$

- To remove degeneracies of $\lambda=1$, replace $\mathbf{S}$ by Google matrix $\mathbf{G}=\alpha \mathbf{S}+(1-\alpha) \frac{\mathbf{E}}{N} ; \quad G P=\lambda P \quad \Rightarrow$ Perron-Frobenius operator
- $\alpha$ models a random surfer with a random jump after approximately 6 clicks (usually $\alpha=0.85$ ); PageRank vector $=>P$ at $\lambda=1\left(\sum_{j} P_{j}=1\right)$.
- CheiRank vector $P^{*}: G^{*}=\alpha \mathbf{S}^{*}+(1-\alpha) \frac{E}{N}, G^{*} P^{*}=P^{*}$
( $\mathbf{S}^{*}$ with inverted link directions)
Fogaras (2003) ... Chepelianskii arXiv:1003.5455 (2010)

## Real directed networks

Real networks are characterized by:

- small world property: average distance between 2 nodes $\sim \log N$
- scale-free property: distribution of the number of ingoing or outgoing links $\rho(k) \sim k^{-\nu}$

PageRank vector for large WWW:

- $P(K) \sim 1 / K^{\beta}$, where $K$ is the ordered rank index
- number of nodes $N_{n}$ with PageRank $P$ scales as $N_{n} \sim 1 / P^{\nu}$ with numerical values $\nu=1+1 / \beta \approx 2.1$ and $\beta \approx 0.9$.
- PageRank $P(K)$ on average is proportional to the number of ingoing links
- CheiRank $P^{*}\left(K^{*}\right) \sim 1 / K^{* \beta}$ on average is proportional to the number of outgoing links $(\nu \approx 2.7 ; \beta=1 /(\nu-1) \approx 0.6)$
- WWW at present: $\sim 10^{11}$ web pages

Donato et al. EPJB 38, 239 (2004)

## Wikipedia ranking of human knowledge

Wikipedia English articles $N=3282257$ dated Aug 18, 2009

Dependence of probability of PagRank $P$ (red) and CheiRank $P^{*}$ (blue) on corresponding rank indexes $K, K^{*}$; lines show slopes $\beta=1 /(\nu-1)$ with $\beta=0.92 ; 0.57$ respectively for $\nu=2.09 ; 2.76$.

Links to Markov chains: $\infty \infty \infty \infty \infty \infty \infty \infty \infty \infty$
Contre-example: Hamiltonian systems with invariant curves, e.g. the Chirikov standard map: noise, induced by coarse-graining, destroys the KAM curves and gives homogeneous ergodic eigenvector at $\lambda=1$

## Ulam method for the Chirikov standard map

Left: spectrum $G \psi=\lambda \psi, M \times M / 2$ cells; $M=280, N_{d}=16609$, exact and Arnoldi method for matrix diagonalization; generalized Ulam method of one trajectory.
Right: modulus of eigenstate of $\lambda_{2}=0.99878 \ldots, M=1600, N_{d}=494964$.
Here $K=K_{G}$
(Frahm, DS (2010))

## Ulam method for dissipative systems

Scattering
$\left\{\begin{array}{l}\bar{y}=y+K \sin (x+y / 2) \\ \bar{x}=x+(y+\bar{y}) / 2(\bmod 2 \pi)\end{array}\right.$

$$
N=110 \times 110, K=7, a=2
$$

$$
\lambda_{1}=0.756 \quad \lambda_{3}=-0.01+i 0.513
$$

Dissipation

$$
\left\{\begin{array}{l}
\bar{y}=\eta y+K \sin x \\
\bar{x}=x+\bar{y}(\bmod 2 \pi)
\end{array}\right.
$$

$$
\begin{aligned}
& N=110 \times 110, K=7, \eta=0.3 \\
& \lambda_{1}=1 \quad \lambda_{3}=-0.258+i 0.445
\end{aligned}
$$

(Ermann, DS (2010))

## Fractal Weyl law

invented for open quantum systems, quantum chaotic scattering: the number of Gamow eigenstates $\boldsymbol{N}_{\gamma}$, that have escape rates $\gamma$ in a finite bandwidth $0 \leq \gamma \leq \gamma_{b}$, scales as
$N_{\gamma} \propto \hbar^{-\nu}, \quad \nu=d / 2$
where $d$ is a fractal dimension of a strange invariant set formed by obits non-escaping in the future and in the past

Perron-Frobenius operators?

## Fractal Weyl law for Ulam networks

Fractal Weyl law for three different models with dimension $d_{0}$ of invariant set. The fractal Weyl exponent $\nu$ is shown as a function of fractal dimension $d_{0}$ of the strange repeller in model 1 and strange attractor in model 2 and Henon map; dashed line shows the theory dependence $\nu=d_{0} / 2$. Inset shows relation between the fractal dimension $d$ of trajectories nonescaping in future and the fractal inv-set dimension $d_{0}$ for model 1 ; dashed line is $d=d_{0} / 2+1$. (Ermann, DS (2010))

## Linux Kernel Network

## Procedure call network for Linux

Links distribution (left); PageRank and inverse PageRank (CheiRank) distribution (right) for Linux versions up to 2.6 .32 with $N=285509\left(\rho \sim 1 / j^{\beta}, \beta=1 /(\nu-1)\right)$.
(Chepelianskii arxiv:1003.5455)

## Fractal Weyl law for Linux Network

Spectrum of Google matrix (left); integrated density of states for relaxation rate $\gamma=-2 \ln |\lambda|$ (right) for Linux versions, $\alpha=0.85$.
(Ermann, Chepelianskii, DS (2011))

## Fractal Weyl law for Linux Network

Number of states $N_{\lambda} \sim N^{\nu}, \quad \nu=d / 2 \quad\left(N \sim 1 / \hbar^{d / 2}\right)$

Number of states $N_{\lambda}$ with $|\lambda|>0.1 ; 0.25$ vs. $N$, lines show $N_{\lambda} \sim N^{\nu}$ with $\nu \approx 0.65$ (left); average mass $<M_{c}>$ (number of nodes) as a functon of network distance $I$, line shows the power law for fractal dimension $\left\langle M_{c}\right\rangle \sim l^{d}$ with $d \approx 1.3$ (right).

## Spectrum of UK University networks

Arnoldi method: Spectrum of Google matrix for Univ. of Cambridge (left) and Oxford (right) in 2006; $20 \%$ at $\lambda=1(N \approx 200000, \alpha=1)$. [Frahm, Georgeot, DS arxiv:1105.1062 (2011)]

## Spectrum of UK University networks

Spectrum of CheiRank Google matrix for Univ. of Cambridge (left) and Oxford (right) in 2006 ( $N \approx 200000, \alpha=1$ ) [Frahm, Georgeot, DS arxiv:1105.1062 (2011)]

## Spectrum of random orthostochastic matrices

Spectrum $N=3$ (left), 4 (right) [K.Zyczkowski et al. J.Phys. A 36, 3425 (2003)]

## Invariant subspaces size distribution

$F(x)$ integrated number of invariant subspaces with size larger that $d / d_{0} ; x=d / d_{0}, d_{0}$ is average size of subspaces (top: Cambridge, Oxford 2002-2006; middle: all others; bottom: Wikipedia CheiRank). Curve: $F(x)=1 /(1+2 x)^{3 / 2}$.

## PageRank at $\alpha \rightarrow 1$

Top: Cambridge, Oxford 2002-2006; bottom: all others $\left(\alpha=1-10^{-8}\right)$.
$P=\frac{1-\alpha}{1-\alpha S} \frac{1}{N} e ; \quad P=\sum_{\lambda_{j}=1} c_{j} \psi_{j}+\sum_{\lambda_{j} \neq 1} \frac{1-\alpha}{(1-\alpha)+\alpha\left(1-\lambda_{j}\right)} c_{j} \psi_{j}$

## Gap of core space at $\alpha=1$

Gap vs $N$ for universities Glasgow, Cambridge, Oxford, Edinburgh, UCL, Manchester, Leeds, Bristol and Birkbeck (2002-2006) and Bath,Hull,Keele,Kent,Nottingham, Aberdeen, Sussex, Birmingham, East Anglia, Cardiff, York (2006). Red dots are for gap $>10^{-9}$ and blue crosses (moved up by $10^{9}$ ) are for Cambridge 2002, 2003 and 2005 and Leeds 2006 with gap $<10^{-16}$; point at $2.91 \cdot 10^{-9}$ is Cambridge 2004 .

## Google matrix of Twitter
