About Quantum Billiards

A point particle moves freely inside an enclosure, reflecting specularly from the boundaries in accordance with Snell’s law.

The problem reduces to solving the Schrödinger equation for the system with Dirichlet boundary conditions.

**Notation**

\( \mathcal{D} \subset \mathbb{R}^2 \), a connected domain on a 2-dimensional Riemannian manifold,

\[-\nabla^2 \Psi_j(\mathbf{r}) = E_j \Psi_j(\mathbf{r}), \quad \mathbf{r} \in \mathcal{D} \text{ and } \Psi_j|_{\partial \mathcal{D}} = 0.\]
Nodal domains of a real wavefunction are the maximally connected regions wherein the function does not change sign.

- The distribution of the numbers of nodal domains \((\nu_{m,n})\) of \(\Psi\) in two dimensions distinguishes between systems with integrable (separable) or chaotic underlying classical dynamics.

- Let \(\xi = \nu_j/j\) and \(I_g(E) = [E, E + gE]\) (\(g > 0\), arbitrary). Then,

\[
P(\xi) = \lim_{E \to \infty} \frac{1}{N_I} \sum_{E_j \in I_g(E)} \delta \left( \xi - \frac{\nu_j}{j} \right).
\]
Definitions

- Let $R_{k,n}$ be an equivalence relation defined on the set of wavefunctions as
  $$R_{k,n} = \{(\Psi(m_1, n), \Psi(m_2, n)) : m_1 \equiv m_2 (\text{mod } kn)\}.$$

- The relation $R_{k,n}$ defines a partition $\mathcal{P}$ of the set of wavefunctions into equivalence classes $[C_{kn}]$ where $C_{kn} = m \text{ mod } kn$.

- Forward difference operator: $\Delta_t \mathcal{F}(x_1, x_2) = \mathcal{F}(x_1 + t, x_2) - \mathcal{F}(x_1, x_2)$. 
The Nodal Domain Theorem

Nodal Domain Theorem for Integrable Billiards

If the metric space $D \subset \mathbb{R}^2$ is integrable, then, in the absence of tiling, one of $\Delta_{kn} \nu(m, n) = \Phi(n)$ and $\Delta_{2kn} \nu(m, n) = \Phi(n)$ holds $\forall m, n$ for some $\Phi : \mathbb{R} \to \mathbb{R}$, which is determined only by the geometry of the billiard.

Proof

This is demonstrated by verifying it individually for all possible integrable billiards on $\mathbb{R}^2$. The corresponding functions $\Phi(n)$ are calculated.

Only 6 geometries to be considered:

- Billiards separable in the coordinate systems:
  - Cartesian
  - Elliptic (including Polar)
  - Parabolic

- Non-separable billiards:
  - Right-angled isosceles triangle
  - (30, 60, 90) hemiequilateral triangle
  - Equilateral triangle

The rectangle

\[ D = [0, L_x] \times [0, L_y]; \alpha = L_x/L_y. \]

\[ \Psi_{m,n} = \sqrt{\frac{4}{L_x L_y}} \sin \left( \frac{m \pi x}{L_x} \right) \sin \left( \frac{n \pi y}{L_y} \right). \]

Energy Spectrum: \( E = m^2 + \alpha^2 n^2. \)

Computing \( \Phi(n) \)

\[ \Delta_{n\nu} (m, n) = \nu_{m+n, n} - \nu_{m, n} = n^2. \]

Hence, \( \nu_{m, n} = mn + C_r; \ C_r = 0. \)

Figure: 'Checkerboard' pattern of nodal domains formed by an intersecting set of nodal lines for the quantum numbers \( m = 4 \) and \( n = 2. \)
The circle

\[ \mathcal{D} = \{(x, y) : x^2 + y^2 \leq R^2\}. \]

\[ \Psi_{m,n} = \frac{J_m(kr)}{\sqrt{\int_0^R [J_m(kr)]^2 r \, dr}} \cdot \frac{\cos m\theta}{\sqrt{\pi}} ; k = \sqrt{\frac{2\mu E}{\hbar^2}}, \]

Energy Spectrum: \( E = [z_{m,n}]^2. \)

Computing \( \Phi(n) \)

\[ \Delta_n \nu (m, n) = 2n^2 \quad \text{if} \quad m \neq 0. \]

Hence, \( \nu_{m,n} = 2mn + C_c; \quad C_c = 0. \)

Figure: Nodal pattern of the circular billiard for the quantum numbers \( m = 4 \) and \( n = 2. \)
Generalisation to the ellipse

- Separable in elliptic coordinates, $\xi$ and $\eta$.
- $\Psi$ described in terms of the radial and angular Mathieu functions.

**Computing $\Phi(n)$**

$$\Delta_\ell \nu (r, \ell) = \nu_{r+\ell, \ell} - \nu_{r, \ell} = 4\ell^2.$$  

Hence, $\nu_{r, \ell} = \ell(4r + 2) + 1$.

When $\ell = 0$, $\nu_{r, \ell} = r + 1$,

thus, trivially, $\Delta_\ell \nu (r, 0) = 4\ell^2 = 0$.

**Figure:** The elliptic billiard (of eccentricity $\sqrt{2}$) displays a similar pattern of nodal domains as observed in the $+ -$ parity mode, symmetric about the X-axis.
Confocal parabolas and general arguments

Consider billiard motion in a domain bounded by confocal parabolas such that \( \Psi \) is separable in the parabolic coordinates \( \sigma \) and \( \tau \) defined by

\[
x = \sigma \tau \quad \text{and} \quad y = \frac{1}{2} \left( \tau^2 - \sigma^2 \right).
\]

It is easy to see that the theorem holds with \( \Delta_n \nu (m, n) \sim n^2 \) since separability implies that \( \nu_{m,n} = mn + O(1) \), where \( m, n \) are the integer quantum numbers.

**Observation**

The same argument may be extended for all separable billiards, including annular regions and sectors of separable billiards.

5 Conclusion

6 References
Right-angled isosceles triangle

\[ D = \{(x, y) \in [0, \pi]^2 : y \leq x\} \]

\[ \psi_{m,n} = \sin(mx) \sin(ny) - \sin(nx) \sin(my). \]

Figure: The pattern of nodal domains for (a) \( \Psi_{7,4} \), (b) \( \Psi_{15,4} \) and (c) \( \Psi_{23,4} \). All the three eigenfunctions belong to the same equivalence class \([C_{2n}]\) and the nodal patterns are similar as the wavefunction evolves from one state to another within members of the same class.

Domains are counted using the Hoshen-Kopelman algorithm.

**Table:** An illustration of the constancy of the first difference of $\nu_{m,n}$ and the nodal loop count, $I_{m,n}$, for the wavefunctions belonging to the same class.
An expression for $\nu_{m,n}$

1. $\nu_{m+2n,n} - \nu_{m,n} = \frac{n^2 + n}{2}$ so, $\nu_{m,n} = \frac{1}{4}m(n + 1) + \alpha(n, C_{2n})$.

2. Let $\zeta_1 = n \mod C_{2n}$ and $\zeta_2 = n \mod 2C_{2n}$. When $C_{2n}$ is even,

$$\nu_{m,n} = \frac{m(n + 1) + n - 2}{4} + \left[ -\frac{n^2}{4} + \left( \frac{C_{2n}}{2} \right)n - \left\{ \frac{C_{2n}^2 - C_{2n} - 1}{2} \pm \frac{1}{4}(\zeta_2 - 1) \right\} \right],$$

with the $+$ sign being applicable when $C_{2n} < \zeta_2$ and the $-$ sign otherwise.

3. When $C_{2n}$ is odd,

$$\nu_{m,n} = \frac{m(n + 1) + n - 2}{4} + \left[ -\frac{n^2}{4} + \left( \frac{C_{2n}}{2} \right)n - \left\{ \frac{2C_{2n}^2 - C_{2n} - 2}{4} + \gamma \right\} \right].$$

4. For $\zeta_1 = 1$, $\gamma = 0$ and for $\zeta_1 = C_{2n} - 1$, $\gamma$ exactly reduces to $\frac{1}{2}(C_{2n} - 1)$.

$$\lim_{k \to \infty} \frac{\gamma}{\nu_{m+kn,n}} = 0; \gamma \text{ is a term responsible for small fluctuations.}$$
30° – 60° – 90° hemiequilateral triangle

The (30, 60, 90) scalene triangle correspond to the states of the equilateral triangle which are antisymmetric about the altitude.

\[
\Delta_{3n}^2 \nu(m,n) = \nu_{m+6n,n} - 2\nu_{m+3n,n} + \nu_{m,n} = 0.
\]

Extensive analysis of a considerable number of lower states shows that, for the non-tiling situations, \( \Delta_{3n} \nu(m,n) \approx n^2 + 1 \).

**Table**: An example showing the values of the second difference of $\nu_{m,n}$ for the wavefunctions on the equilateral triangle corresponding to the same class, defined by $m \mod 3n$. 
An expression for $\nu_{m,n}$

- $\nu_{m+6n,n} - 2\nu_{m+3n,n} + \nu_{m,n} = 3n^2$.

- $\nu_{m,n} = \frac{3}{2} \left( \frac{m^2}{9} - \frac{mn}{3} \right) + \frac{m}{3n} \alpha(n,C_{3n}) + \beta(n,C_{3n})$

- $\nu_{m,n} = \frac{m^2}{6} - \frac{(4n-3)m}{6} + n^2 - \frac{C_{3n}n - \lambda_1(C_{3n},n)}{3}$ if $0 < C_{3n} < n$
  
  $\nu_{m,n} = \frac{m^2}{6} - \frac{(4n-3)m}{6} + n^2 - \frac{2(C_{3n}n - n - \lambda_2(C_{3n},n))}{3}$ if $n < C_{3n} < 3n$

$\lambda_1$ and $\lambda_2$ contribute to small variations in the nodal domain count.

- $\lambda_1(C_{3n}, C_{3n} + 1) = C_{3n}^2 + 3$
  
  $\lambda_2(C_{3n}, 2C_{3n} + 1) = \lambda_2(C_{3n}, 2C_{3n} + 2) = C_{3n}(C_{3n} + 3)$.

5. Conclusion

6. References
In this presentation, for all integrable systems, we see that the number of domains, $\nu_{m,n}$ of an eigenfunction satisfies a difference equation.

As classifying patterns in non-separable shapes and counting domains has been a very difficult problem, the theorem presented here marks a considerable advance.

In short, the geometrical patterns have been algebraically represented.

Thank you!
